History

- Belinson-Drinfeld;
- Lurie, Ayala-Francis;
- Kupers-Miller, Knudsen, ...

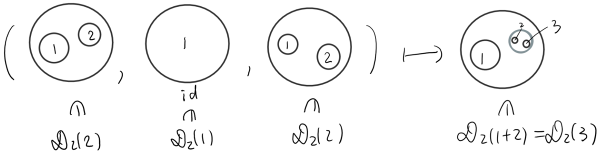
little n-disk operad

The operad $\mathscr{D}_n$ has the following data:

little n-disk operad

The operad $\mathscr{D}_n$ has the following data:

- Spaces $\mathscr{D}_n(k) = \{e_1, \cdots, e_k |$ conditions $\}$.
  - Each $e_i : D^n \to D^n$ is in the form of $e_i(\mathbf{v}) = a\mathbf{v} + \mathbf{b}$ for $a > 0, \mathbf{b} \in D^n$.
  - The images of e_i's are disjoint;
- Struture maps $\gamma : \mathscr{D}_n(k) \times \mathscr{D}_n(j_1) \times \cdots \times \mathscr{D}_n(j_k) \to \mathscr{D}_n(j_1 + \cdots + j_k)$.



G-operad

- G: finite group. V: n-dimensional orthogonal G-representation.

G-operad

- G: finite group. V: n-dimensional orthogonal G-representation.
- A G-operad in Top is an operad such that the spaces are G-spaces and structure maps are G-equivariant.

G-operad

- G: finite group. V: n-dimensional orthogonal G-representation.
- A G-operad in Top is an operad such that the spaces are G-spaces and structure maps are G-equivariant. Equivalently, it is an operad in Top^G.

G-operad

- G: finite group. V: n-dimensional orthogonal G-representation.
- A G-operad in Top is an operad such that the spaces are G-spaces and structure maps are G-equivariant. Equivalently, it is an operad in Top^G.

Example

1. Replacing the disk D^n by the unit disk $D(V)$, we get the little V-disk operad $\mathscr{D}_V$ (Guillou-May).

E_n-algebra

- The (reduced) operad $\mathscr{D}_n$ is associated with a monad $\mathrm{D}_n : \mathrm{Top}_* \to \mathrm{Top}_*$:

$$\mathrm{D}_n X = \coprod_k \mathscr{D}_n(k) \times_{\Sigma_k} X^k / \sim$$

- An E_n-algebra is a spece A with structure maps

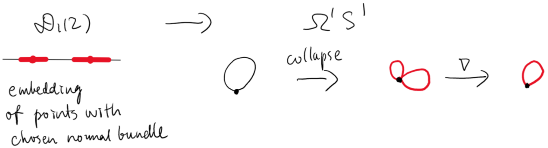
$$\lambda : \mathrm{D}_n A \to A.$$

E_n-algebra

Example

$\Omega^n X$ is an E_n-algebra.

$$\mathrm{D}_n(\Omega^n X) \xrightarrow{s(\Omega^n X)} \Omega^n \Sigma^n (\Omega^n X) \xrightarrow{\text{counit}} \Omega^n X.$$



E_n-algebra

One alternative way to see an E_n-algebra A:

- Let $\mathrm{Disk}_n^{\mathrm{fr}}$ be the symmetric monoidal topological category with

$$\begin{aligned} \text{obj} &: [k] \text{ for } k \geq 0; \\ \text{mor} &: \mathrm{Emb}^{\mathrm{fr}}(\sqcup_k D^n, \sqcup_l D^n); \\ \otimes &: [k] \otimes [l] \cong [k+l]. \end{aligned}$$

E_n-algebra

One alternative way to see an E_n-algebra A:

- Let $\mathrm{Disk}_n^{\mathrm{fr}}$ be the symmetric monoidal topological category with

$$\begin{aligned} \text{obj} &: [k] \text{ for } k \geq 0; \\ \text{mor} &: \mathrm{Emb}^{\mathrm{fr}}(\sqcup_k D^n, \sqcup_l D^n); \\ \otimes &: [k] \otimes [l] \cong [k+l]. \end{aligned}$$

- Then A is a symmetric monoidal topological functor $\mathrm{Disk}_n^{\mathrm{fr}} \to \mathrm{Top}$.

factorization homology for framed manifold

Factorization homology of framed manifolds with coefficient A is the symmetric monoidal topological left Kan extension:

$$\begin{tikzcd} \mathrm{Disk}_n^{\mathrm{fr}} \arrow[r, "A"] \arrow[d] & \mathcal{C} \\ \mathrm{Mfld}_n^{\mathrm{fr}} \arrow[ur, dotted, "\int_{\_} A"'] & \end{tikzcd}$$

the Top^G-category $\mathrm{Mfld}_n^{\mathrm{fr}_V}$

Definition

A smooth G-manifold is V-framed if there is G-vector bundle isomorphism

$$\mathrm{T}M \cong M \times V.$$

Example

1. V is V-framed;

the Top^G-category $\mathrm{Mfld}_n^{\mathrm{fr}_V}$

Definition

A smooth G-manifold is V-framed if there is G-vector bundle isomorphism

$$\mathrm{T}M \cong M \times V.$$

Example

1. V is V-framed;
2. $G = C_2$. Let σ be the sign representation. Then S^σ is σ-framed.

the Top^G-category $\mathrm{Mfld}_n^{\mathrm{fr}_V}$

Definition

A smooth G-manifold is V-framed if there is G-vector bundle isomorphism

$$\mathrm{T}M \cong M \times V.$$

Example

1. V is V-framed;
2. $G = C_2$. Let σ be the sign representation. Then S^σ is σ-framed.
3. $G = C_p$. Then S^1_{rot} is $\mathbb{R}$-framed.

the Top^G-category $\mathrm{Mfld}_n^{\mathrm{fr}_V}$

Definition

A smooth G-manifold is V-framed if there is G-vector bundle isomorphism

$$\mathrm{T}M \cong M \times V.$$

Example

1. V is V-framed;
2. $G = C_2$. Let σ be the sign representation. Then S^σ is σ-framed.
3. $G = C_p$. Then S^1_{rot} is $\mathbb{R}$-framed.
4. $G = C_p$. Let λ be the 2-dimensional rotation representation. Then $S^1_{\mathrm{rot}} \times \mathbb{R}$ is both λ- and $\mathbb{R}^2$-framed.

the Top^G-category $\mathrm{Mfld}_n^{\mathrm{fr}_V}$

Definition

A smooth G-manifold is V-framed if there is G-vector bundle isomorphism

$$\mathrm{T}M \cong M \times V.$$

Example

1. V is V-framed;
2. $G = C_2$. Let σ be the sign representation. Then S^σ is σ-framed.
3. $G = C_p$. Then S^1_{rot} is $\mathbb{R}$-framed.
4. $G = C_p$. Let λ be the 2-dimensional rotation representation. Then $S^1_{\mathrm{rot}} \times \mathbb{R}$ is both λ- and $\mathbb{R}^2$-framed.

Construction

Following Kupers-Miller, we construct a symmetric monoidal Top^G-category $(\mathrm{Mfld}_n^{\mathrm{fr}\,V}, \sqcup)$ of V-framed manifolds such that $\mathrm{Aut}(V) \simeq *$.

Construction

Following Kupers-Miller, we construct a symmetric monoidal Top^G-category $(\mathrm{Mfld}_n^{\mathrm{fr}\,V}, \sqcup)$ of V-framed manifolds such that $\mathrm{Aut}(V) \simeq *$.
(Idea: Steiner paths.)

Construction

Following Kupers-Miller, we construct a symmetric monoidal Top^G-category $(\mathrm{Mfld}_n^{\mathrm{fr}_V}, \sqcup)$ of V-framed manifolds such that $\mathrm{Aut}(V) \simeq *$.
(Idea: Steiner paths.)

- Endormosphism operad $\mathscr{D}_V^{\mathrm{fr}_V}$ and monad $\mathrm{D}_V^{\mathrm{fr}_V}$. ($\mathscr{D}_V^{\mathrm{fr}_V}$ is equivalent to $\mathscr{D}_V$.)
- Moreover, any manifold M gives rise to a functor

$$
\begin{aligned}
\mathrm{D}_M^{\mathrm{fr}_V}: \quad \mathrm{Top}^G &\to \mathrm{Top}^G \\
X &\mapsto \textstyle\coprod_{k\geq 0} \mathrm{Emb}^{\mathrm{fr}_V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim .
\end{aligned}
$$

Construction

Following Kupers-Miller, we construct a symmetric monoidal Top^G-category $(\mathrm{Mfld}_n^{\mathrm{fr}_V}, \sqcup)$ of V-framed manifolds such that $\mathrm{Aut}(V) \simeq *$.
(Idea: Steiner paths.)

- Endormosphism operad $\mathscr{D}_V^{\mathrm{fr}_V}$ and monad $\mathrm{D}_V^{\mathrm{fr}_V}$. ($\mathscr{D}_V^{\mathrm{fr}_V}$ is equivalent to $\mathscr{D}_V$.)
- Moreover, any manifold M gives rise to a functor

$$\begin{array}{rrcl} \mathrm{D}_M^{\mathrm{fr}_V}: & \mathrm{Top}^G & \to & \mathrm{Top}^G \\ & X & \mapsto & \coprod_{k\geq 0} \mathrm{Emb}^{\mathrm{fr}_V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim . \end{array}$$

- $\mathrm{D}_M^{\mathrm{fr}_V} X$ is the V-fattened configuration space on M with based labels in X.

Proposition

Evaluation at 0 *gives a* G*-homotopy equivalence*

$$ev_0 : \mathrm{D}_M^{\mathrm{fr}_V} X \to \coprod_k \mathrm{PConf}(M, k) \times_{\Sigma_k} X^k / \sim .$$

Construction

Following Kupers-Miller, we construct a symmetric monoidal Top^G-category $(\mathrm{Mfld}_n^{\mathrm{fr}_V}, \sqcup)$ of V-framed manifolds such that $\mathrm{Aut}(V) \simeq *$.
(Idea: Steiner paths.)

- Endormosphism operad $\mathscr{D}_V^{\mathrm{fr}_V}$ and monad $\mathrm{D}_V^{\mathrm{fr}_V}$. ($\mathscr{D}_V^{\mathrm{fr}_V}$ is equivalent to $\mathscr{D}_V$.)
- Moreover, any manifold M gives rise to a functor

$$\begin{aligned} \mathrm{D}_M^{\mathrm{fr}_V} : \quad \mathrm{Top}^G &\to \mathrm{Top}^G \\ X &\mapsto \textstyle\coprod_{k\geq 0} \mathrm{Emb}^{\mathrm{fr}_V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim . \end{aligned}$$

- $\mathrm{D}_M^{\mathrm{fr}_V} X$ is the V-fattened configuration space on M with based labels in X.

Proposition

Evaluation at 0 gives a G-homotopy equivalence

$$ev_0 : \mathrm{D}_M^{\mathrm{fr}_V} X \to \coprod_k \mathrm{PConf}(M, k) \times_{\Sigma_k} X^k / \sim .$$

structures

$$\mathrm{D}_M^{\mathrm{fr}_V}(X) = \coprod_{k \geq 0} \mathrm{Emb}^{\mathrm{fr}_V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim .$$

structures

$$\mathrm{D}_M^{\mathrm{fr}_V}(X) = \coprod_{k \geq 0} \mathrm{Emb}^{\mathrm{fr}_V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim .$$

- Composition $\mathrm{D}_M^{\mathrm{fr}_V} \circ \mathrm{D}_V^{\mathrm{fr}_V} \to \mathrm{D}_M^{\mathrm{fr}_V}$; $\mathrm{D}_V^{\mathrm{fr}_V} \circ \mathrm{D}_V^{\mathrm{fr}_V} \to \mathrm{D}_V^{\mathrm{fr}_V}$;
- Unit $\mathrm{Id} \to \mathrm{D}_V^{\mathrm{fr}_V}$ from the element $\mathrm{id} : V \to V$;

Take a (non-degenerately based) $\mathrm{D}_V^{\mathrm{fr}_V}$-algebra A in Top^G,

- Struture map $\mathrm{D}_V^{\mathrm{fr}_V}(A) \to A$.

structures

$$\mathrm{D}^{\mathrm{fr}_V}_M(X) = \coprod_{k\geq 0} \mathrm{Emb}^{\mathrm{fr}_V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim .$$

- Composition $\mathrm{D}^{\mathrm{fr}_V}_M \circ \mathrm{D}^{\mathrm{fr}_V}_V \to \mathrm{D}^{\mathrm{fr}_V}_M$; $\mathrm{D}^{\mathrm{fr}_V}_V \circ \mathrm{D}^{\mathrm{fr}_V}_V \to \mathrm{D}^{\mathrm{fr}_V}_V$;
- Unit $\mathrm{Id} \to \mathrm{D}^{\mathrm{fr}_V}_V$ from the element $\mathrm{id} : V \to V$;

Take a (non-degenerately based) $\mathrm{D}^{\mathrm{fr}_V}_V$-algebra A in Top^G,

- Struture map $\mathrm{D}^{\mathrm{fr}_V}_V(A) \to A$.

We have a simplicial G-space:

$$\mathbf{B}_\bullet(\mathrm{D}^{\mathrm{fr}_V}_M, \mathrm{D}^{\mathrm{fr}_V}_V, A) = \mathrm{D}^{\mathrm{fr}_V}_M(\mathrm{D}^{\mathrm{fr}_V}_V)^\bullet(A).$$

structures

$$\mathrm{D}_M^{\mathrm{fr}V}(X) = \coprod_{k\geq 0} \mathrm{Emb}^{\mathrm{fr}V}(\sqcup_k V, M) \times_{\Sigma_k} X^k / \sim .$$

- Composition $\mathrm{D}_M^{\mathrm{fr}V} \circ \mathrm{D}_V^{\mathrm{fr}V} \to \mathrm{D}_M^{\mathrm{fr}V}$; $\mathrm{D}_V^{\mathrm{fr}V} \circ \mathrm{D}_V^{\mathrm{fr}V} \to \mathrm{D}_V^{\mathrm{fr}V}$;
- Unit $\mathrm{Id} \to \mathrm{D}_V^{\mathrm{fr}V}$ from the element $\mathrm{id} : V \to V$;

Take a (non-degenerately based) $\mathrm{D}_V^{\mathrm{fr}V}$-algebra A in Top^G,

- Struture map $\mathrm{D}_V^{\mathrm{fr}V}(A) \to A$.

We have a simplicial G-space:

$$\mathbf{B}_\bullet(\mathrm{D}_M^{\mathrm{fr}V}, \mathrm{D}_V^{\mathrm{fr}V}, A) = \mathrm{D}_M^{\mathrm{fr}V}(\mathrm{D}_V^{\mathrm{fr}V})^\bullet(A).$$

Definition

The factorization homology of M with coefficient A is

$$\int_M A := \mathbf{B}(\mathrm{D}_M^{\mathrm{fr}V}, \mathrm{D}_V^{\mathrm{fr}V}, A).$$

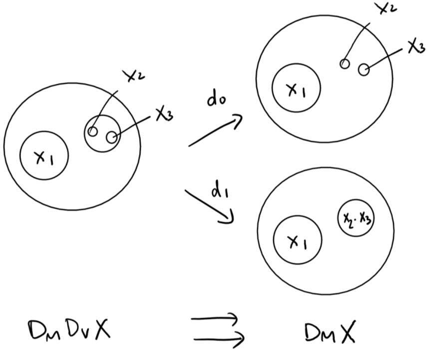
structure

$$\int_M A := \mathbf{B}(\mathrm{D}_M^{\mathrm{fr}_V}, \mathrm{D}_V^{\mathrm{fr}_V}, A).$$

structure

$$\int_M A := \mathbf{B}(\mathrm{D}_M^{\mathrm{fr}_V}, \mathrm{D}_V^{\mathrm{fr}_V}, A).$$

The bar construction is a model for configuration spaces with E_V-summable labels (Salvatore).



scanning map

- The scanning maps on configuration spaces have studied by McDuff, Segal, Bödigheimer, Manthorpe-Tillmann, ...
- It maps a configuration of points on M to a section of the tangent bundle. Intuitivly, it is the Pontryagin-Thom collapse map.

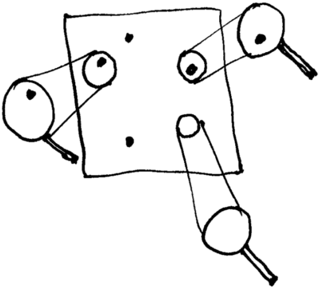


Figure: illustration of the scanning map by Church

- It maps a configuration of points on M to a section of the tangent bundle.

- It maps a configuration of points on M to a section of the tangent bundle.
- In our V-framed case, it takes the form:

Construction

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(X) \to \mathrm{Map}_*(M^+, \Sigma^V X).$$

- It maps a configuration of points on M to a section of the tangent bundle.
- In our V-framed case, it takes the form:

Construction

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(X) \to \mathrm{Map}_*(M^+, \Sigma^V X).$$

- For labelled configuration space on a G-manifold M, the following theorem has been proved geometricly: (for $M = V$, it is the equivariant recognition priciple by Guiloou-May)

Theorem (Rourke-Sanderson)

The scanning map is a G-weak equivalence if X is G-connected.

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(X) \to \mathrm{Map}_*(M^+, \Sigma^V X).$$

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(X) \to \mathrm{Map}_*(M^+, \Sigma^V X).$$

The scanning map is simplicial:

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet(X) \to \mathrm{Map}_*(M^+, \Sigma^V(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet X).$$

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(X) \to \mathrm{Map}_*(M^+, \Sigma^V X).$$

The scanning map is simplicial:

$$s : \mathrm{D}_M^{\mathrm{fr}_V}(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet(X) \to \mathrm{Map}_*(M^+, \Sigma^V(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet X).$$

So it realizes to

$$\int_M A = \mathrm{D}_M^{\mathrm{fr}_V}(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet(X) \to |\mathrm{Map}_*(M^+, \Sigma^V(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet X)|$$
$$\to \mathrm{Map}_*(M^+, |\Sigma^V(\mathrm{D}_V^{\mathrm{fr}_V})^\bullet X|) = \mathrm{Map}_*(M^+, \mathbf{B}^V A).$$

Nonabelian Poincaré duality

Theorem (Z.)

Let M be a V-framed manifold and A be a $\mathrm{D}_V^{\mathrm{fr}_V}$-algebra in Top^G. Assume that A is non-degenerately based and G-connected. Then the scanning map induces a G-weak equivalence:

$$\int_M A \to \mathrm{Map}_*(M^+, \mathbf{B}^V A).$$

Application: baby equivariant Poincaré duality

Let A be a discrete $\mathbb{Z}[G]$-module. Then it is a G-E_∞-space.

Application: baby equivariant Poincaré duality

Let A be a discrete $\mathbb{Z}[G]$-module. Then it is a G-E_∞-space.

$$\int_M A = M \otimes A.$$

The equivariant Dold-Thom theorem:

Theorem (Lima-Filho, Santos)

$$\pi_\star^G(X \otimes A) \cong \tilde{\mathrm{H}}_\star^G(X, \underline{A}).$$

Application: baby equivariant Poincaré duality

Let A be a discrete $\mathbb{Z}[G]$-module. Then it is a G-E_∞-space.

$$\int_M A = M \otimes A.$$

The equivariant Dold-Thom theorem:

Theorem (Lima-Filho, Santos)

$$\pi^G_\star(X \otimes A) \cong \tilde{\mathrm{H}}^G_\star(X, \underline{A}).$$

Corollary

For V-framed manifold M, there is isomorphism:

$$\tilde{\mathrm{H}}^G_\star(M, \underline{A}) \cong \mathrm{H}_G^{V-\star}(M^+, \underline{A}).$$

Application: factorization homology on Thom spectra

Theorem (Horev-Klang-Z.)

Let A be the Thom spectrum of an E_{V+1}-map $\Omega^{V+1}X \to \mathrm{Pic}(\mathrm{Sp}^G)$ such that X is suitably connected. Then

$$\int_{S^V \times \mathbb{R}} A \simeq A \wedge \Omega X_+.$$

Application: factorization homology on Thom spectra

Theorem (Horev-Klang-Z.)

Let A be the Thom spectrum of an E_{V+1}-map $\Omega^{V+1}X \to \mathrm{Pic}(\mathrm{Sp}^G)$ such that X is suitably connected. Then

$$\int_{S^V \times \mathbb{R}} A \simeq A \wedge \Omega X_+.$$

Take $G = C_2$. Let σ be the sign representation, $\rho \cong \sigma + 1$ the 2-dimensional regular representation.

Application: factorization homology on Thom spectra

Theorem (Horev-Klang-Z.)

Let A be the Thom spectrum of an E_{V+1}-map $\Omega^{V+1}X \to \mathrm{Pic}(\mathrm{Sp}^G)$ such that X is suitably connected. Then

$$\int_{S^V \times \mathbb{R}} A \simeq A \wedge \Omega X_+ .$$

Take $G = C_2$. Let σ be the sign representation, $\rho \cong \sigma + 1$ the 2-dimensional regular representation.

Theorem (Behrens-Wilson)

The Eilenberg-MacLane spectrum $\mathrm{H}\underline{\mathbb{F}_2}$ is equivariantly the Thom spectrum of a ρ-fold loop map $\Omega^\rho S^{\rho+1} \to B_{C_2}O$.

Application: factorization homology on Thom spectra

Theorem (Horev-Klang-Z.)

Let A be the Thom spectrum of an E_{V+1}-map $\Omega^{V+1}X \to \mathrm{Pic}(\mathrm{Sp}^G)$ such that X is suitably connected. Then

$$\int_{S^V \times \mathbb{R}} A \simeq A \wedge \Omega X_+.$$

Take $G = C_2$. Let σ be the sign representation, $\rho \cong \sigma + 1$ the 2-dimensional regular representation.

Theorem (Behrens-Wilson)

The Eilenberg-MacLane spectrum $\mathrm{H}\underline{\mathbb{F}_2}$ is equivariantly the Thom spectrum of a ρ-fold loop map $\Omega^\rho S^{\rho+1} \to B_{C_2}O$.

Corollary

$$THR(\mathrm{H}\underline{\mathbb{F}_2}) \simeq \mathrm{H}\underline{\mathbb{F}_2} \wedge (\Omega S^{\rho+1})_+.$$

Tangential structure

- $B_G O(n)$: the classifying space for G-equivariant n-dimensional vector bundle.

Tangential structure

- $B_G O(n)$: the classifying space for G-equivariant n-dimensional vector bundle.
- Tangential structure: a map $\theta : B \to B_G O(n)$.
- θ-framing on M: a G-bundle map $\phi : \mathrm{T}M \to \theta^*\gamma$, where γ is the universal bundle on $B_G O(n)$.
- Equivalently,

$$\begin{tikzcd}
 & B \arrow[d, "\theta"] \\
M \arrow[ur, dotted, "\tau_B"] \arrow[r, "\tau"] \arrow[ur, phantom, "\Uparrow", shift right=3ex] & B_G O(n)
\end{tikzcd}$$

E_V^θ-algebra

Let θ be a tangential structure such that V is θ-framed.
We can identify $\mathscr{D}_V^\theta$ with a semidirect product of $\mathscr{D}_V$ (Salvatore-Wahl):

Proposition

There is an equivalence of G-operads: $\mathscr{D}_V^\theta \simeq \mathscr{D}_V \rtimes (\mathrm{Aut}^\theta(V))$.
(Here, $\mathrm{Aut}^\theta(V)$ is a group object in Top^G. It is equivalent to ΩB.)

E_V^θ-algebra

Let θ be a tangential structure such that V is θ-framed.
We can identify $\mathscr{D}_V^\theta$ with a semidirect product of $\mathscr{D}_V$ (Salvatore-Wahl):

Proposition

There is an equivalence of G-operads: $\mathscr{D}_V^\theta \simeq \mathscr{D}_V \rtimes (\mathrm{Aut}^\theta(V))$.
(Here, $\mathrm{Aut}^\theta(V)$ is a group object in Top^G. It is equivalent to ΩB.)

In terms of algebras:

$$(\mathrm{Top}^G)^\Pi \cong \mathrm{Top}^{\Pi \rtimes_\alpha G}.$$

$$\mathscr{C}[\mathrm{Top}^G] \cong (\mathscr{C} \rtimes G)[\mathrm{Top}].$$

$$(\mathscr{C} \rtimes \Pi)[\mathrm{Top}^G] \cong \mathscr{C}[\mathrm{Top}^{\Pi \rtimes_\alpha G}] \cong \mathscr{C} \rtimes (\Pi \rtimes_\alpha G)[\mathrm{Top}].$$

Thank you!
